### Q1: choose the correct answer:

What is the modulo operator in Python?

%

/

//

^

What is the keyword used to define a loop that continues until a condition is met?

for

while

do-while

repeat-until

How do you return a value from a function in Python?

return value

print value

result = value

output value

What is the result of the following expression:  $5 + 3 * 2$ ?

16

11

10

13

### Write a Python code to multiply two numbers.

```
def multiply_numbers(num1, num2):  
    """  
    This function multiplies two numbers and returns the result.  
  
    Args:  
        num1: The first number.  
        num2: The second number.  
  
    Returns:  
        The product of num1 and num2.  
    """  
    return num1 * num2  
  
# Get input from the user  
num1 = float(input("Enter the first number: "))  
num2 = float(input("Enter the second number: "))  
  
# Calculate the product  
product = multiply_numbers(num1, num2)  
  
# Print the result  
print("The product of", num1, "and", num2, "is:", product)
```

**Q1 : Read and put True(✓) or false (✗) :**

1. Python is a case-sensitive language.

Answer: **True**

2. Lists in Python are immutable.

Answer: **False**

3. The range() function generates a sequence of numbers.

Answer: **True**

4. In Python, == is used to check if two objects have the same value, while is checks if they are the same object.

Answer: **True**

**Match the word in column (A) with the correct option**

**in column (B):**

| A             | # | B                                         |
|---------------|---|-------------------------------------------|
| 1. List       | 4 | Unordered collection of unique elements   |
| 2. Dictionary | 1 | Ordered, mutable collection of elements   |
| 3. Tuple      | 3 | Ordered, immutable collection of elements |
| 4. Set        | 2 | Unordered collection of key-value pairs   |

|                |          |           |    |

1- What is the output of the following code?

```
print(2 ** 3)
```

- a) 6
- b) 8
- c) 9
- d) 23

**Answer:** b) 8

2- Which of the following is used to define a function in Python?

- a) func
- b) def
- c) function
- d) define

**Answer:** b) def

3- What does the len() function do?

- a) Returns the type of an object
- b) Returns the length of an object
- c) Converts a string to lowercase
- d) Deletes an object

**Answer:** b) Returns the length of an object

4- Which of the following is a valid Python variable name?

- a) 1variable
- b) variable\_name
- c) variable-name
- d) variable name

**Answer:** b) variable\_name

**Find the output of the following code:**

```
x = 5  
y = "John"  
print(x)  
print(y)
```

output .....5.....

John

```
print((6 + 3) - (6 + 3))
```

output .....0.....

**Arrange the following steps to create and call a function in Python in the correct order.**

1. Define the function using def.
2. Call the function by its name.
3. Write the code block inside the function.
4. Add parameters to the function (if needed).

Correct Order:

1 → 4 → 3 → 2

|                |          |           |    |
|----------------|----------|-----------|----|
| Subject        | Computer | worksheet |    |
| Student's Name | .....    | Grade     | 11 |

### Fill in the blanks to complete the code.

1. Complete the code to print "Hello, World!":

```
python
Copy
print("_____")
```

**Answer:** Hello, World!

2. Complete the code to create a list of numbers from 1 to 5:

```
python
Copy
numbers = [1, 2, 3, 4, ____]
```

**Answer:** 5

### Short Answer

1. What is the difference between `append()` and `extend()` in Python lists?

**Answer:**

- `append()` adds a single element to the end of the list.
- `extend()` adds multiple elements (from an iterable) to the end of the list.

2. What is the purpose of the `if __name__ == "__main__":` statement?

**Answer:**

It ensures that the code block under it runs only when the script is executed directly, not when it is imported as a module.
