Student's Name		Grade	12

Q1: choose the correct answer:

Which programming language is commonly used for industrial robots?

Python	Java	C++	JavaScript
--------	------	-----	------------

Industrial robots are primarily used for:

Household chores	Manufacturing tasks	Medical procedures	Space exploration
------------------	---------------------	--------------------	-------------------

Robots used in space exploration are known as:

Space robots	Underwater robots	Military robots	Medical robots
--------------	-------------------	-----------------	----------------

In which field are robots widely used for surgical procedures?

Medicine	Agriculture	Construction	Education
----------	-------------	--------------	-----------

Write a Python code to divide two numbers.

```
def divide_numbers(num1, num2):  
    """  
    This function divides two numbers and returns the result.  
  
    Args:  
        num1: The numerator.  
        num2: The denominator.  
  
    Returns:  
        The quotient of num1 divided by num2.  
  
    Raises:  
        ZeroDivisionError: If num2 is zero.  
    """  
    if num2 == 0:  
        raise ZeroDivisionError("Cannot divide by zero.")  
    return num1 / num2  
  
# Get input from the user  
num1 = float(input("Enter the numerator: "))  
num2 = float(input("Enter the denominator: "))  
  
try:  
    # Calculate the quotient  
    quotient = divide_numbers(num1, num2)  
  
    # Print the result  
    print("The quotient of", num1, "divided by", num2, "is:", quotient)
```

Q1 : Read and put True(✓) or false (✗) :

- 1) Python supports object-oriented programming. (✓)
- 2) The print() function is used to display output to the console (✓)
- 3) Lists in Python are immutable (✗)
- 4) Indentation is not significant in Python (✗)
- 5) Python supports multiple inheritance. (✓)

Q2 : List the standard data types in python.

- Numbers
- Strings
- List
- Tuples
- Dictionary

Fill in the Blanks:

(print() – Debugging – for - Constant)

1. The process of finding and fixing errors in code is called Debugging
2. In Python, the print() function is used to display output.
3. A Constant is a value that cannot be changed during program execution.
4. The for loop is used when the number of iterations is known.

What is the output of the following code?

```
print(2 + 3 * 4)
```

14

Student's Name		Grade	12

Multiple Choice (Choose the correct answer)

1. What is the output of the following code?

```
python
```

Copy

```
print(2 + 3 * 4)
```

- a) 20
 - b) **14**
 - c) 24
 - d) 9
2. Which of the following is NOT a programming language?
- a) Python
 - b) Java
 - c) **HTML**
 - d) C++
3. What does the "if" statement do in programming?
- a) Repeats a block of code
 - b) **Executes a block of code if a condition is true**
 - c) Defines a function
 - d) Stops the program
4. Which data type is used to store whole numbers?
- a) Float
 - b) String
 - c) **Integer**
 - d) Boolean
5. What is the purpose of a loop in programming?
- a) To store data
 - b) **To repeat a block of code**
 - c) To define a function
 - d) To debug code

Subject	Computer	worksheet	
Student's Name		Grade	12

Arrange the following steps in the correct order to write and run a program:

- (2) Write the code in a text editor or IDE.
- (3) Save the file with the correct extension (e.g., .py for Python).
- (4) Run the program using a compiler or interpreter.
- (5) Debug and fix any errors.
- (1) Plan the logic of the program.

Match the programming term on the left with its definition on the right.

- 1. Variable
 - 2. Function
 - 3. Loop
 - 4. Array
 - 5. Syntax
-
- a) A block of code that performs a specific task.
 - b) A container that holds multiple values of the same type.
 - c) A named storage location in memory.
 - d) The set of rules that define the structure of a program.
 - e) A structure that repeats a block of code.

Matching answer

1. c) A named storage location in memory.
2. a) A block of code that performs a specific task.
3. e) A structure that repeats a block of code.
4. b) A container that holds multiple values of the same type.
5. d) The set of rules that define the structure of a program.

Write a Python code to multiply two numbers.

```
def multiply_numbers(num1, num2):  
    """  
    This function multiplies two numbers and returns the result.  
  
    Args:  
        num1: The first number.  
        num2: The second number.  
  
    Returns:  
        The product of num1 and num2.  
    """  
    return num1 * num2  
  
# Get input from the user  
num1 = float(input("Enter the first number: "))  
num2 = float(input("Enter the second number: "))  
  
# Calculate the product  
product = multiply_numbers(num1, num2)  
  
# Print the result  
print("The product of", num1, "and", num2, "is:", product)
```
