

Animation and Transition

13

Today in class, our teacher made a really cool presentation. The title and images popped up from the side and moved around – it was awesome!

That is called an animation, Keya! We can add effects like that to your presentation too.

In our presentation about water pollution, we added titles, images, and text. However, it can still be made more impressive. Themes can be added to show similarity between all the slides. This lets the audience know that they are all from the same project.

13. Animation and Transition

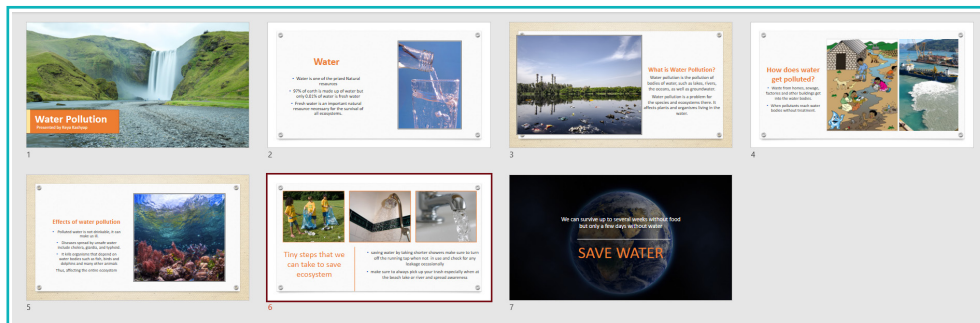

Theme

A Theme is a predefined combination of colours, fonts, and effects. Each theme uses a different slide layout.

We will duplicate our initial presentation so that the first one remains unchanged. We can refer to it while we make our new presentation.

- Open the presentation we created earlier.
- Go to File and then click on Open.
- Go in the folder it is saved and double click on it.

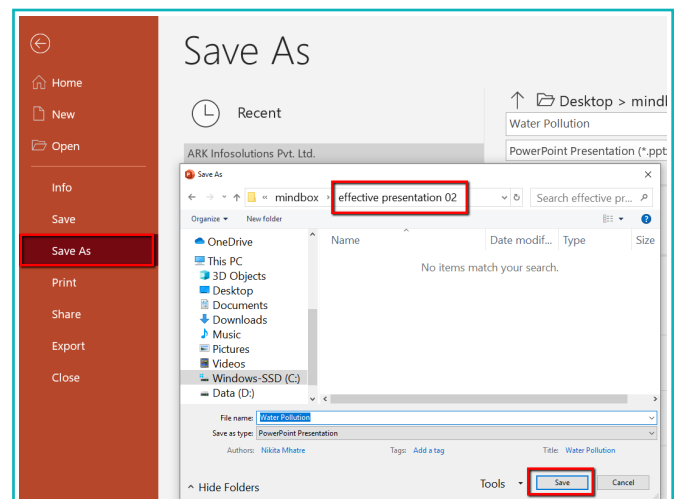

Right now, our presentation looks like this:

We will not make changes in same presentation.
We will create a duplicate presentation.

To create a duplicate presentation:

- Go to File and click on Save As.

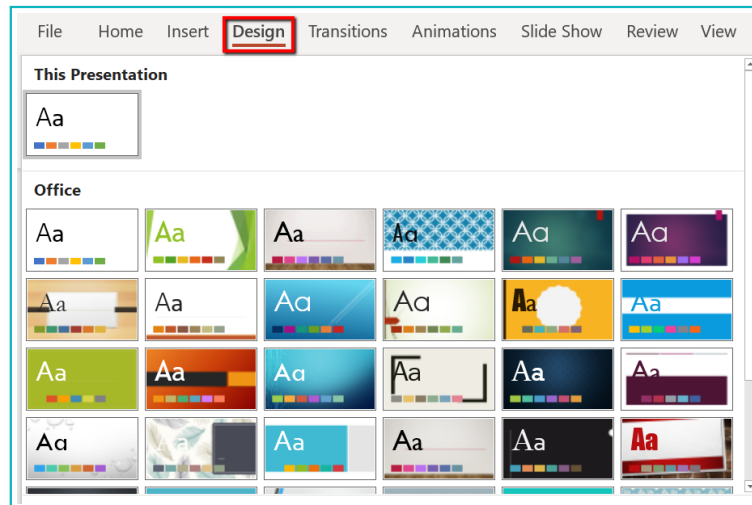

Save As is a function similar to **Save**. It lets us specify the name and select a location to save the file. Give a new name to the file.

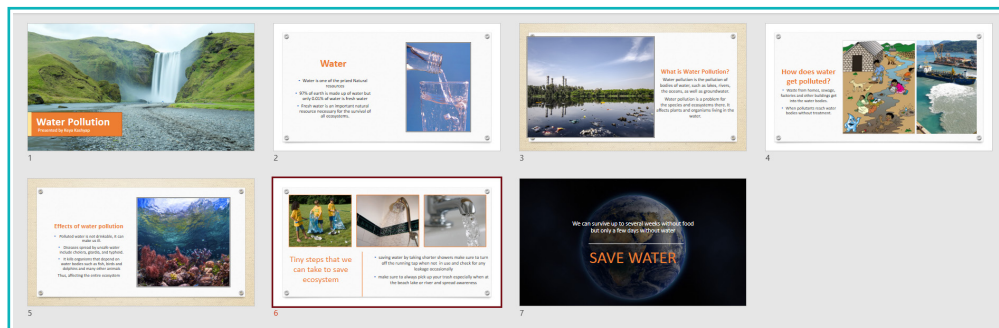

Each theme uses its own set of slide layouts. It controls the primary colour palette, text fonts, and other basic elements. This saves us time when we format and design the presentation.

Apply theme

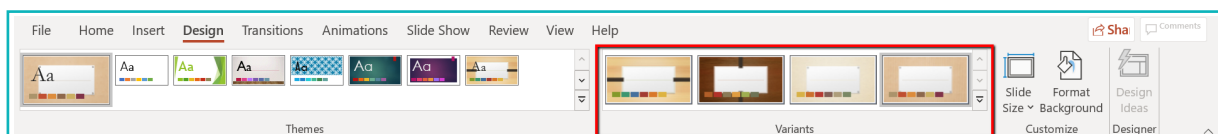

Select the Design tab from the Ribbon and locate Themes. Each image represents a theme. Select a theme to apply to the presentation.

The theme will affect the entire presentation. Observe how the slides change their looks.

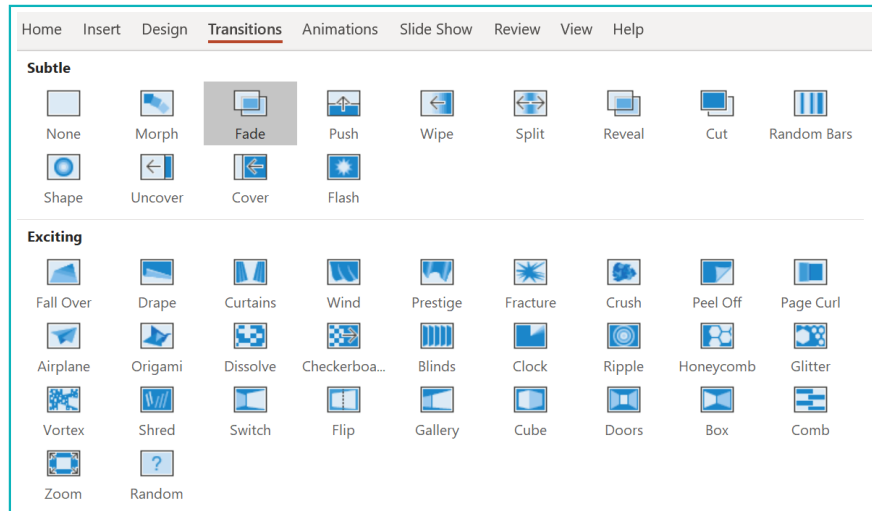

We can change the colour of theme with **Variants**. Variants keep the theme's overall look and change the theme colours.

If we run the presentation as a slide show, we find that the slides only contain text and images. Let's add some transitions to make the presentation appealing.

- A **Transition** is a motion effect which is visible in the Slide Show view when we move from one slide to the next.
- A transition can be a simple fade out to the next slide or a flashy eye-catching effect.

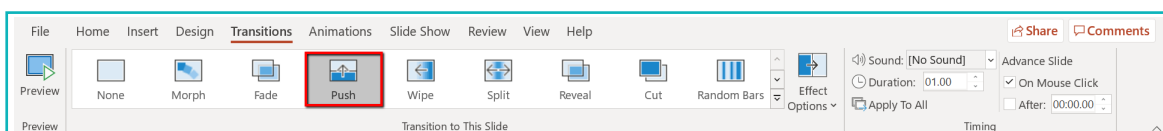

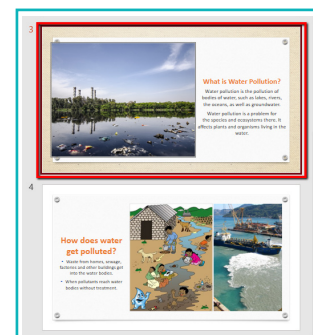

There are three categories of transitions to choose from which can be found on the Transitions tab.

- **Subtle:** This is a basic type of transition which uses simple animations to move between slides.
- **Exciting:** This type uses complex animations to transition between slides.
- **Dynamic Content:** This type of transition only works with placeholders and not entire slides.

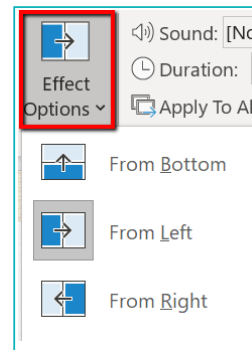

Apply transitions

To apply transitions to slides, follow these steps:

- 1 Select a slide from the Slide Navigation pane. The transition will apply to this slide.
- 2 Select the Transitions tab and locate Transition to This Slide.

- 3 Some transitions have effect options to decide the direction of movement for the slide. Slides can move from the bottom, top, left, or right.

- 4 Select a transition to apply it to the slide. This automatically previews the transition.

Note:

Transitions should be used in moderation. We can use one subtle transition for each slide. Too many transitions can distract the audience from the content of the presentation.

- 5 Use F5 to run a slideshow and check how the transitions look.

Exercise

Tick mark ☒ the correct answer

- 1 Which option is used to duplicate a file?

a. Save ☐	b. Save As ☐
c. New ☐	d. Open ☐
- 2 Which tab contains “Themes”?

a. Home ☐	b. Insert ☐
c. Design ☐	d. Transition ☐
- 3 Which option can be used to change the colour of a theme?

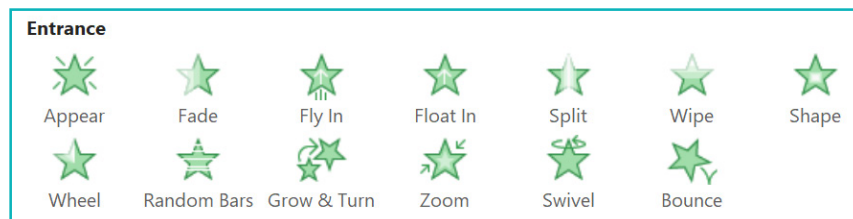

a. Variant ☐	b. Themes ☐
c. Transitions ☐	d. Effect ☐

We learnt how to use transitions to add effects to slides in our presentation. Similarly, we can add animation to the content in each slide.

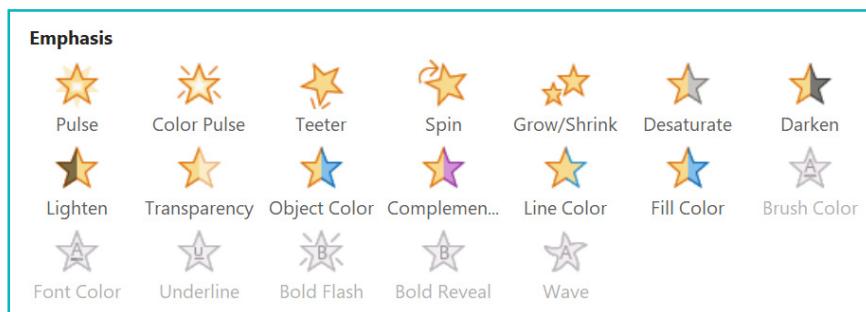

- **Animation** is the movement of content on a slide in a presentation.
- A well animated slide can grab the audience's attention.

There are four types of animation:

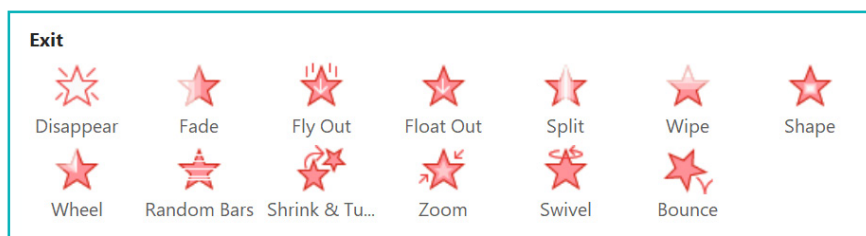

- 1 **Entrance:** This type of animation controls how the object enters onto the slide.

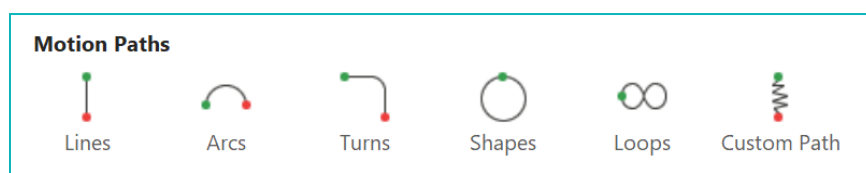

- 2 **Emphasis:** This type of animation takes place when the object is already on the slide. It is usually triggered by a mouse click.

- 3 **Exit:** This type of animation controls how the object exits the slide.

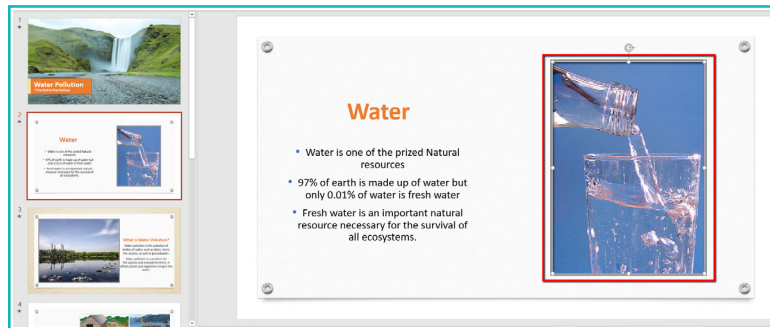

- 4 **Motion Paths:** This type is similar to the Emphasis effects. The content or object moves within the slide on a motion path which we predetermine.

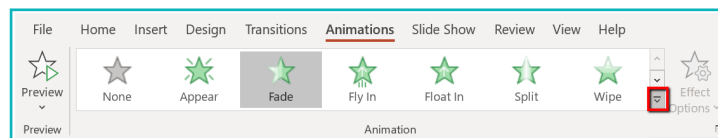

Apply Animation

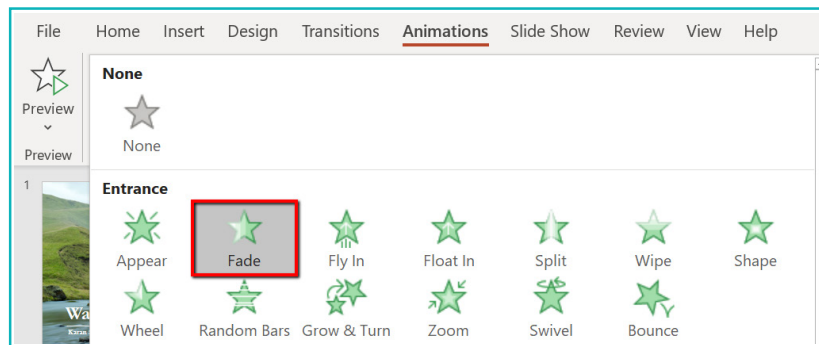

- 1 Select the object to animate.

- 2 In the Animations tab, click on the More drop-down arrow.

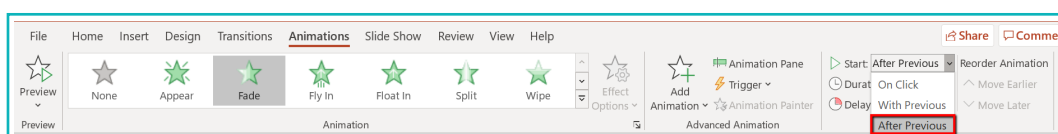

- 3 A drop-down menu of animation effects will appear. Select an effect to use.

Along with the type of animation, we can also select the timing for it.

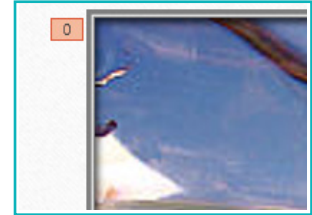

For example:

- We have chosen 'fade' as the animation style. Go to 'Timing', then choose an option from the 'Start' drop down list.
- Here we have chosen 'After Previous'.
- 'After Previous' shows the current object after the earlier object completes its animation.

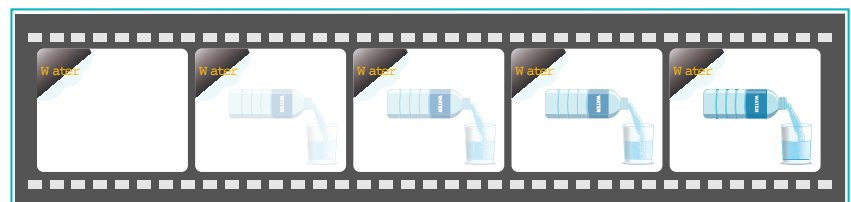

- A correctly timed animation makes a presentation attractive and effective.
- By default, the time is 'On Click'.

Every time we animate an object, a number will appear next to it.

For example: Fade animation

In a fade animation, the object slowly appears onto the slide.

Note:

It is a good idea to use animations in a few places. They should be used effectively to attract the attention of the audience, not to distract them.

Now that you know how to add transitions and animations to a presentation, experiment with all the different types of effects. Find the ones you like and use those to make your presentation effective!

Exercise

 State whether True or False

4 Animations are of four types.

 _____

5 "Timing" is used to set the time for the animation to appear.

 _____

6 Animation is used for slides and transition is used for content in the slide.

 _____

Awesome, I will add transitions and animations to the rest of presentation too! I'm sure my class will enjoy it.

That's great Keya, but don't use too many!

Tech Flash

- **Theme** : A theme is a predefined combination of colours, fonts, and effects. Each theme uses a different slide layout.
- **Variants** : Variants change the theme colours while its overall look is preserved.
- **Transitions** : A transition is a motion effect which is visible in Slide Show view when we move from one slide to the next in a presentation.
- **Animations** : Animations are motion effects added to text or objects on slides in a presentation.
