

Posters can convey a great deal of information, from spreading awareness to announcing an event.

Poster:

A poster is a large, printed sheet that contains text and images. It is posted in a public space to share a message, promote an idea, product, or event. A poster helps to convey information in an attractive and effective manner. It grabs the public's attention with pictures, symbols, and text.

Common aims of a poster

Poster to raise awareness

Poster to advertise a new store opening

Poster to announce an event

Poster to protest for a cause

To spread a message faster, it is important to communicate with many people at once. There are a variety of ways to do that. Large posters are one of the most beneficial ways. They have some significant advantages:

- Posters are a form of advertising. Creating and distributing posters is cheaper than radio or television ads.
- Posters create quick, immediate visual impressions on the audience.

As depicted in the above posters, some characteristics of a well-designed poster are:

- A clearly structured message or statement
- Visible from a distance with large and bold text
- Well sized fonts and limited font styles
- Clearly written headlines
- Effective use of the entire space
- Good contrast of colours

In this lesson, we will learn to create a poster to inform students about a study trip to King Abdulaziz City for Science and Technology. Posters can be printed in various sizes. We need to make sure the printed poster does not pixelate, and the graphics quality is maintained irrespective of its size. For this, we will create our poster in **Vectr** application.

It's pretty sweet how posters display information so attractively. Can I make one for our study tour?

You surely can.
Let's make it together.

Activity

Create a poster in the Vectr application to inform students about a study trip to King Abdulaziz City for Science and Technology.

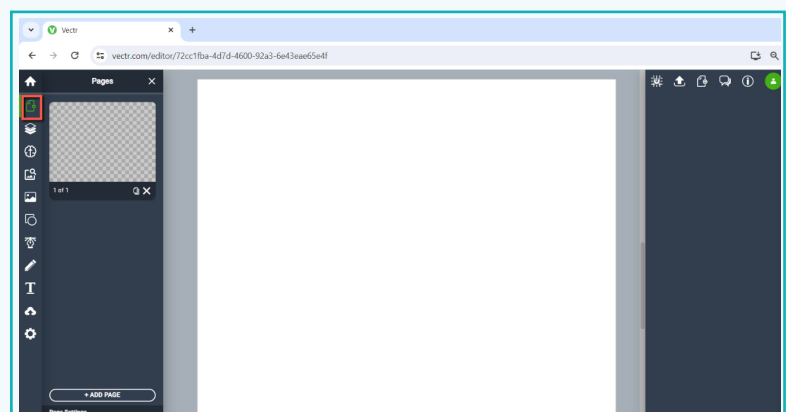

We will create this poster:

The printers that we use in offices or homes can print a maximum size of A4. An A4 size paper is 210 mm × 297 mm. To print it at school or at home, we will create an A4 size poster.

1 Open Vectr.com in the browser

- To set the page size, click on the 'page' tab.

Bytes

“King Abdulaziz City for Science and Technology” (KACST) is a scientific research and development institution that focuses on various areas of science and technology, including space research, renewable energy, artificial intelligence, and more.

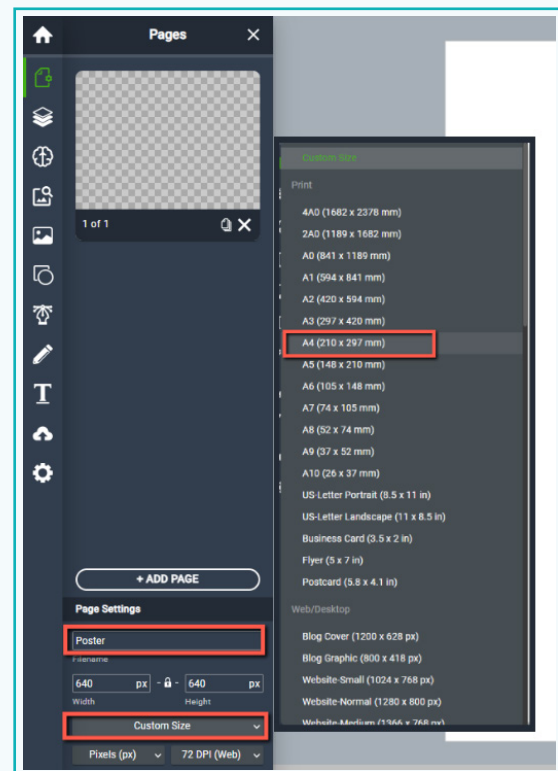

Activity

2 Set the appropriate page size

The page panel displays pages available in the document and allows us to set the page properties as well as the file name of the page.

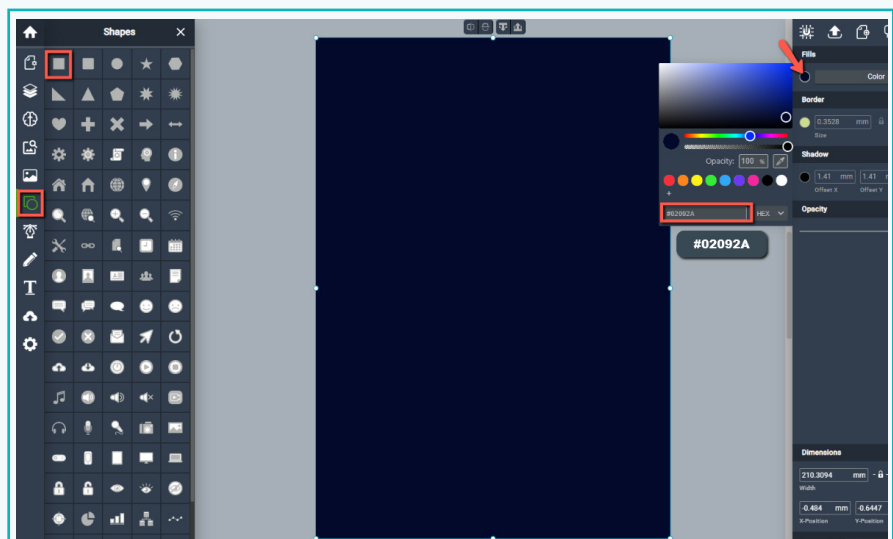

- Click on 'custom size' in page settings and set the page size to 'A4'.

Once the page settings are ready, we can create a backdrop for the poster. The backdrop of our poster will have a starry night sky.

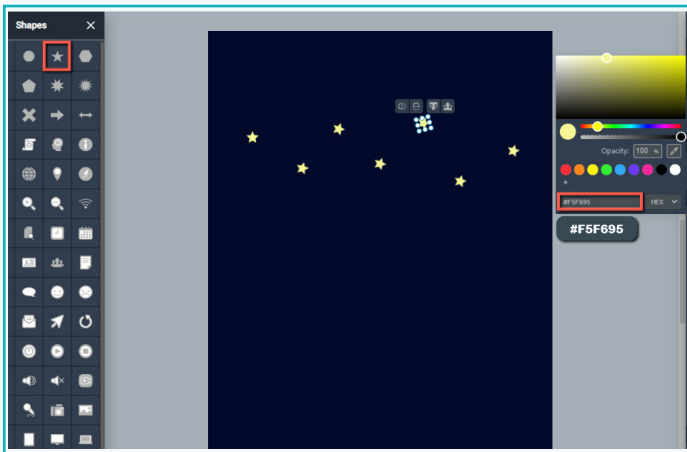

3 Create a backdrop for the poster

For the backdrop, use a rectangle and select an appropriate colour to create a night sky.

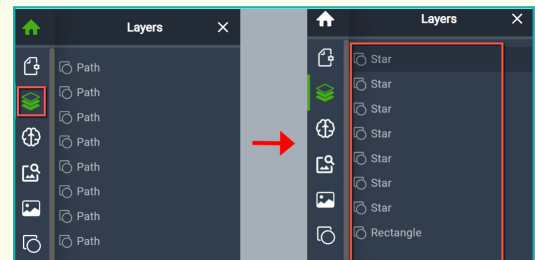

Activity

4 Add stars to create a starry night sky

Note:

All the shapes included in the page will be available in the layers panel. We can rename the shapes to make the list more organized.

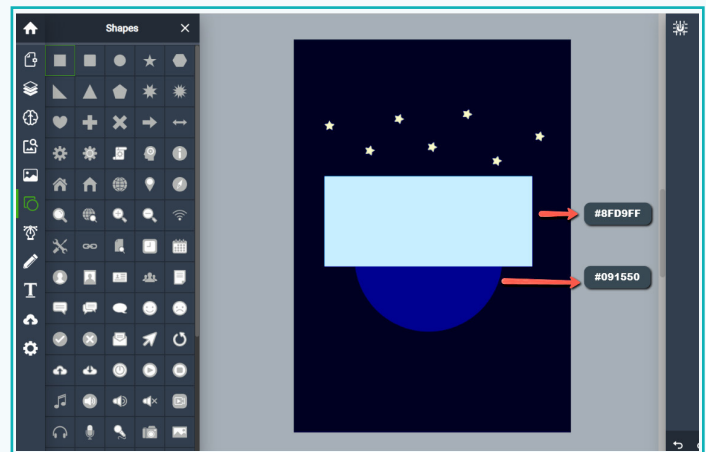

After the backdrop, we will create illustrations of the space centre and a rocket.

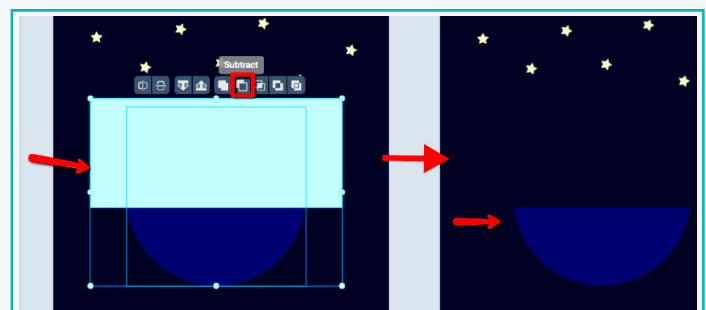

5 Create the space centre illustration

- For the ground, create a semicircle. To make a semicircle, let us first draw a circle and overlap it with a rectangle.

Since we don't have a specific option to create a semicircle, we need to create a circle and remove top half of it.

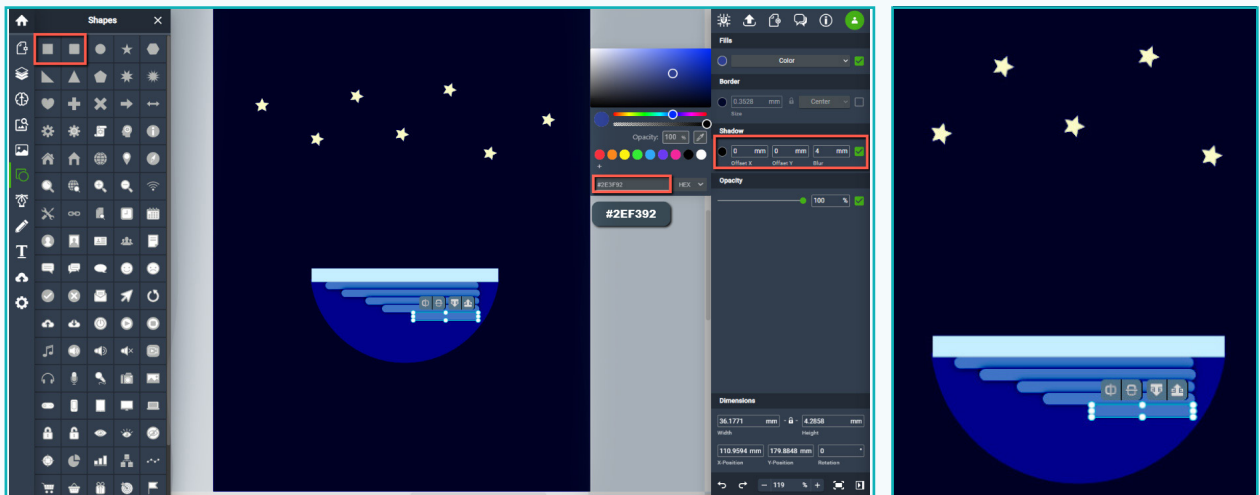

- Select the circle and rectangle together and choose the 'subtract' option.

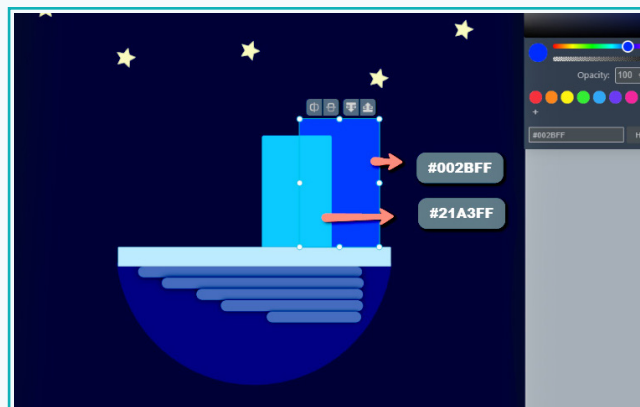

Activity

6 Add other elements using rectangles and rounded rectangles

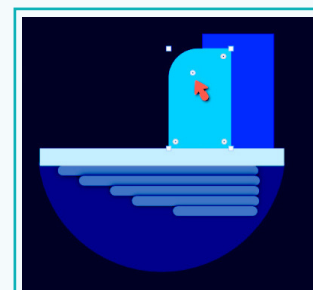

Refer to the image below. Use rectangles and rounded rectangles to create elements for the space centre.

7 For the space centre buildings, add 2 more rectangles

- To make the buildings more aesthetic, we will make the upper corners round.
- Double click on a shape to enter edit mode or to modify shapes.
- Double click on the rectangle to edit it. Click and drag the points that appear within the shape to round off the corner.

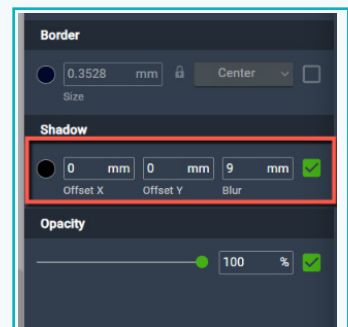

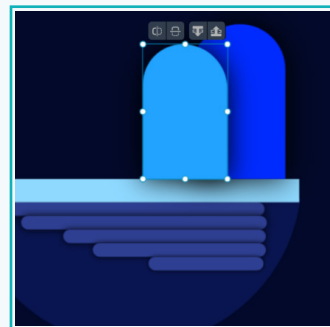

Activity

d. Repeat it on the other points.

To make the two buildings distinct, let's add shadows.

8 Add a shadow to the building in front

- Select the building in front. In the properties panel, select the shadow property checkbox to add a shadow.
- Set properties as shown.

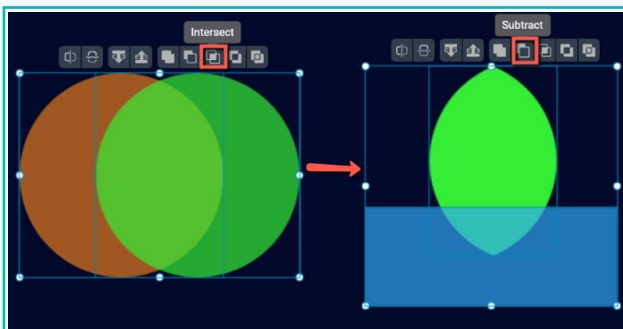

Note:

We can notice that the buildings are in front of the blue rectangle. As a result, we need to change the layers. Select the blue rectangle by opening the layers panel, then drag it to the top of the buildings.

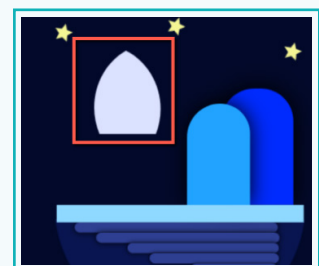

We will use multiple shapes to create a rocket.

9 Create a rocket

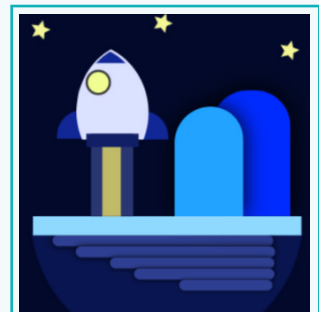

- Overlap 2 circles

- With the 'intersect' and 'subtract' technique, we can achieve the shape as shown:

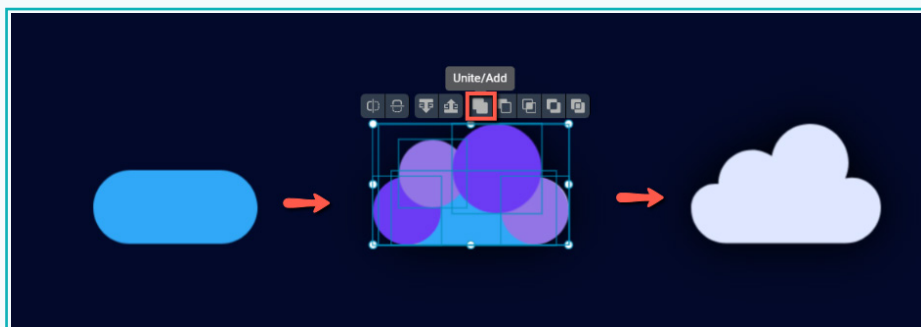

- To complete the rocket, add more details.

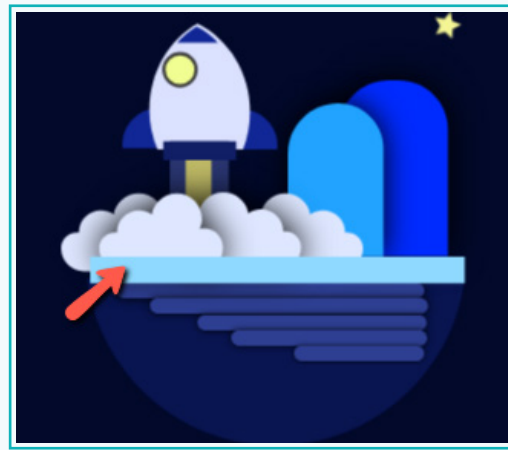

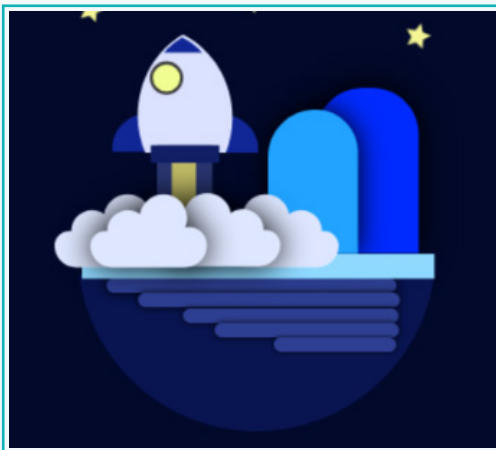

Activity

- 10** To create the illusion of smoke, we can add some cloud-like shapes beneath the rocket.

Create a cloud shape by arranging rounded rectangles and circles, then select every shape and use 'Unite'.

- Duplicate and place the clouds around the bottom of the rocket and add shadows to the upper clouds. Arrange the blue rectangle over the clouds using layers.

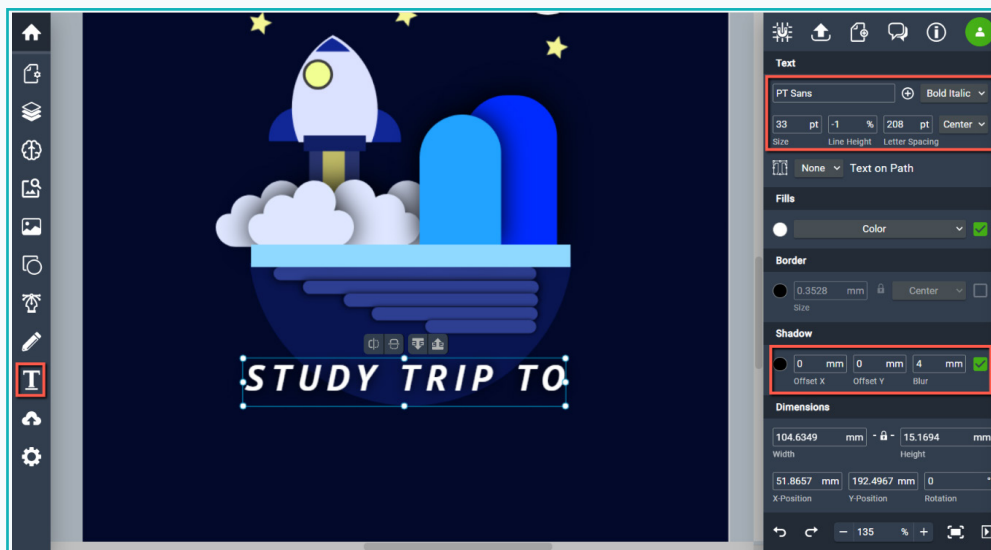

A poster conveys necessary information for an event. In this case, it will be the purpose of the poster to display the date when the trip is planned and contact details for any information required.

Activity

11 Write necessary information about the trip

For an impactful poster, we should follow the characteristics of a well-designed poster.

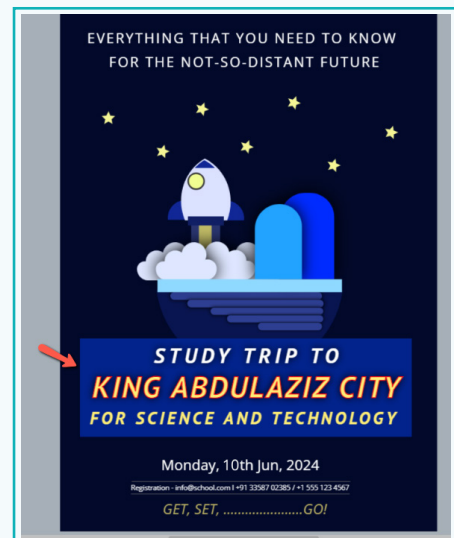

- Use the text tool and click on the canvas to type.
- Change the font style and size to make the text more impactful.

- Add the rest of the text to complete the information.

- To add focus to the title element, we can add shapes behind the title text.

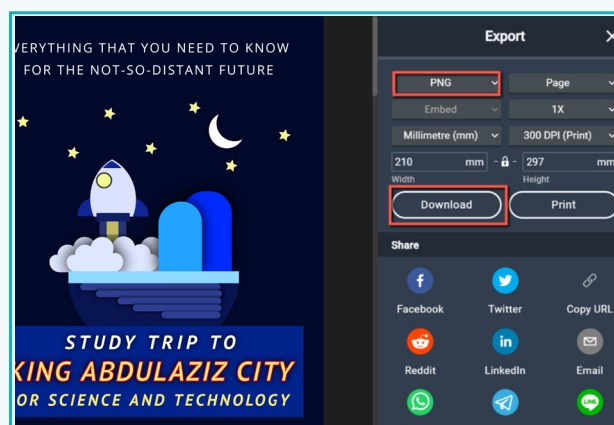

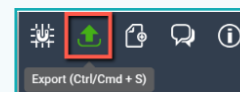

Activity

e. Add more elements to customise the poster.

12 Save the file

- Export the artwork in 'PNG' format.

Our poster is now ready!

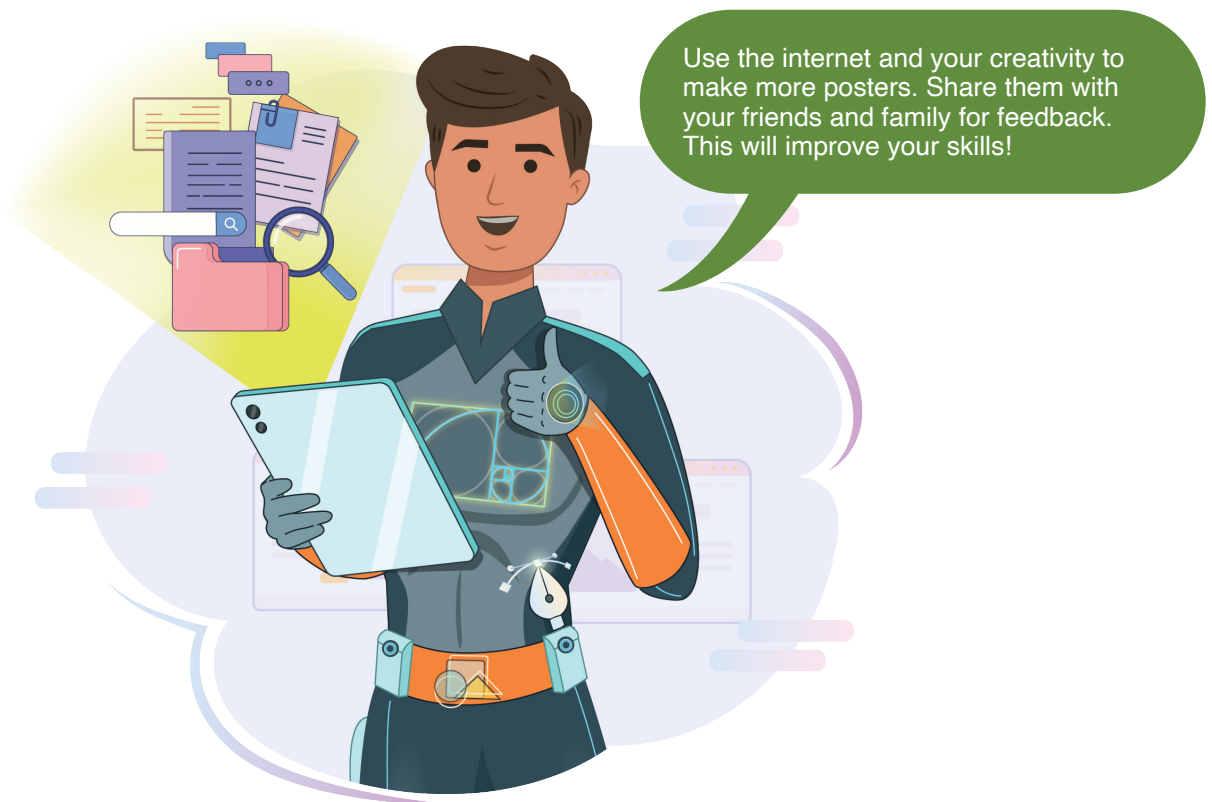

Final output

In this lesson, we learnt about posters and their uses. We created our own poster in Vectr to talk about an upcoming event.

Exercise

Fill in the blanks

- 1 The dimensions of an A4 size paper are _____.
- 2 The _____ option is used to remove the overlaying shape.
- 3 _____ allows us to set parameters for text, changing its appearance.

Tech Flash

- **Page panel** : The page panel displays pages available in the document and allows us to set page properties.
- **Shadow property** : The Shadow property casts a shadow of the object or shape.
