

Power of Digital Art

13

I created a painting of the Sun a few days ago. Now I want to draw mountains and hide the Sun behind them. How should I do that?

Yes, you can do it using layers. Let me show you how.

Recall:

Sketchbook is used to create Digital painting with a Pen Tablet. It has various tools:

- Brushes
- Eraser
- Color Editor
- Shape Tools

To show an object is behind another object we draw only the visible part of it on paper.

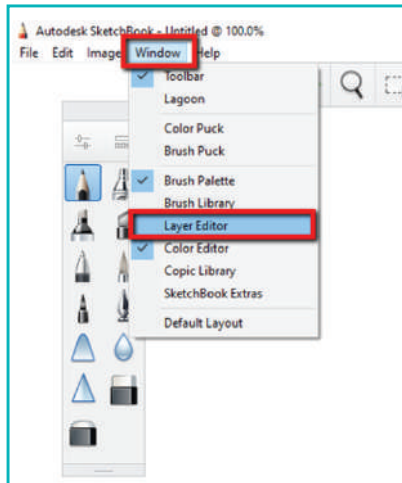

Example : A drawing of a house

In this drawing, the fence and the bushes are behind the house. Some part of the fence and bushes cannot be seen.

Layer:

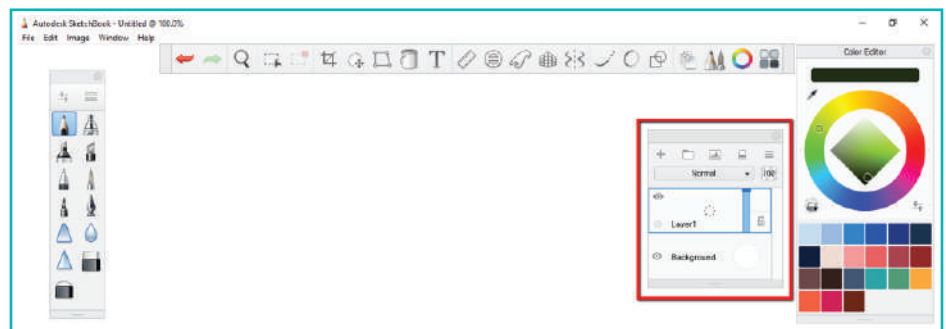

In Sketchbook, we use Layers to draw objects in front or behind of other objects. Layers also help us to draw and colour objects without affecting other objects.

Layer Editor:

Layer Editor in Sketchbook is used to add and delete layers.

- Go to **Window** menu and open the **Layer Editor**.

Activity

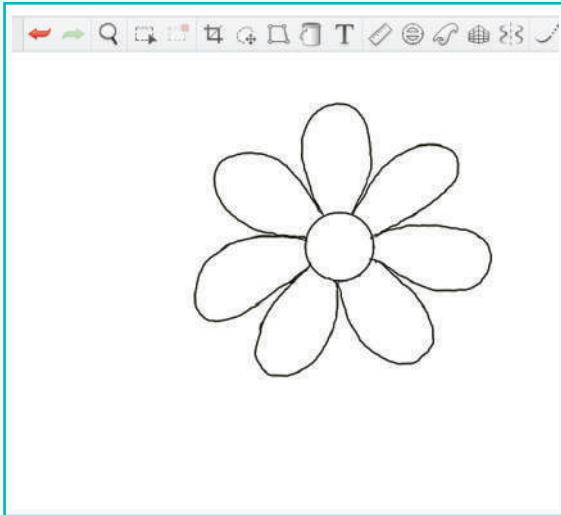

Use layers to draw a butterfly over a flower.

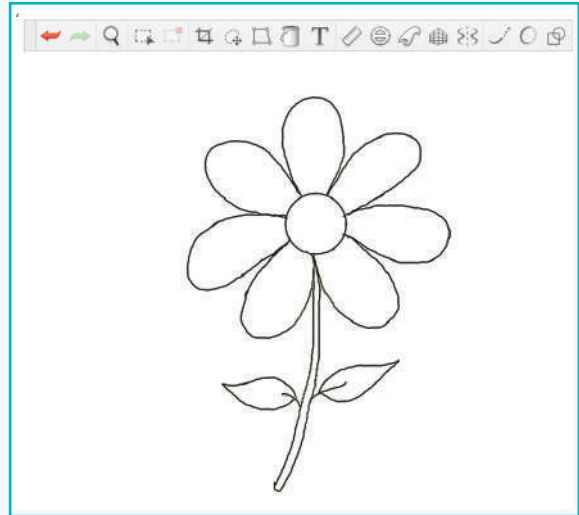

Butterfly over a flower

Activity

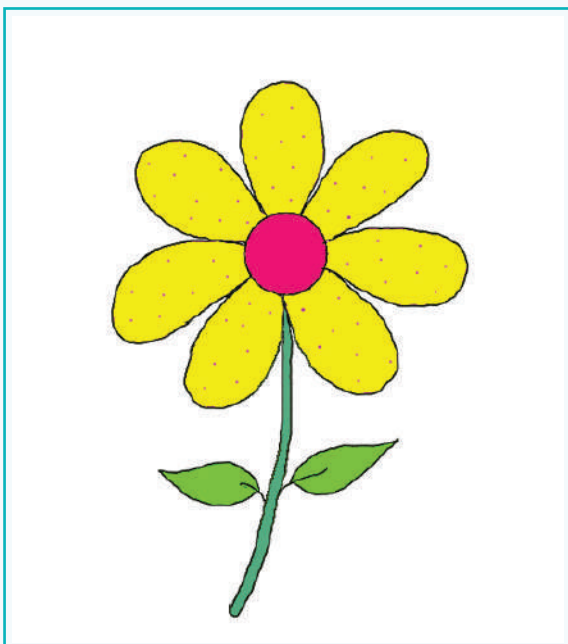

1 Draw a **flower** on **layer 1**.

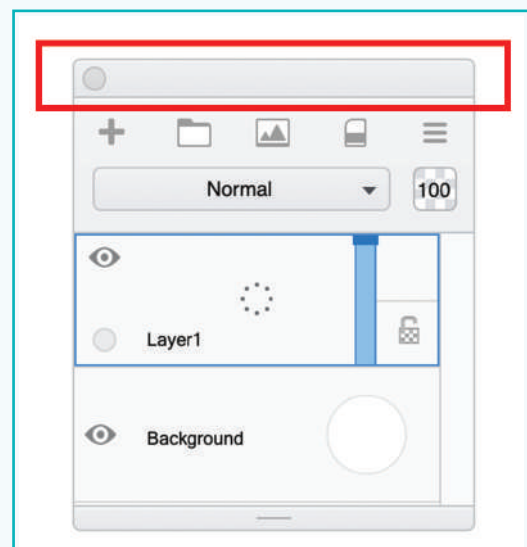

2 Draw the **stem** and **leaves** for the flower.

3 Colour the flower with colours of your choice.

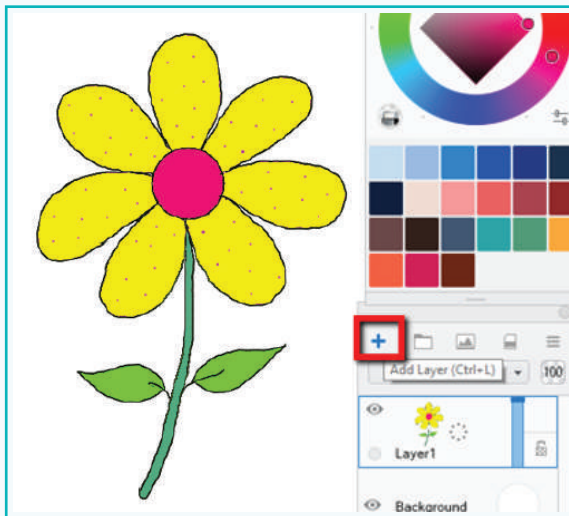

To change the position of the Layer window, drag the grey area anywhere in the workspace.

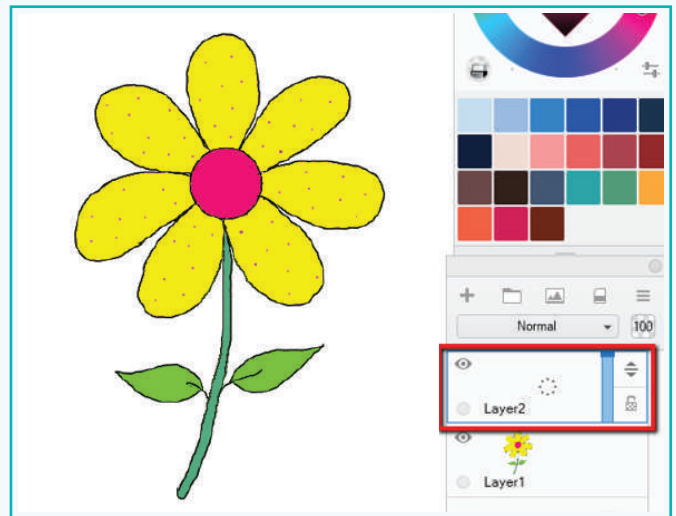

Activity

4 a. Add a **new layer**.

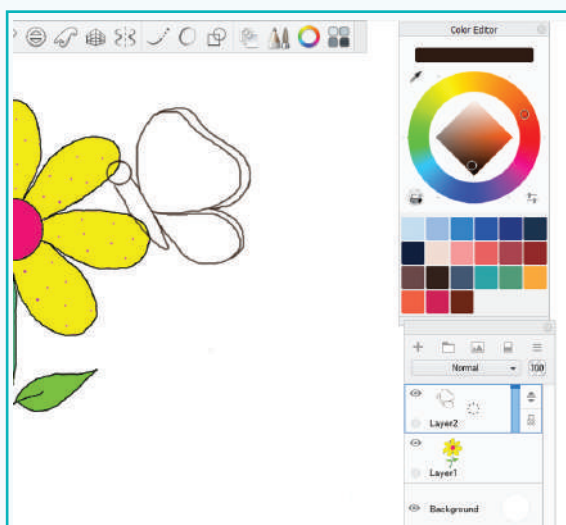

b. Add Layer is used to add a new layer. When we change something in a layer, it is not visible on any other layer.

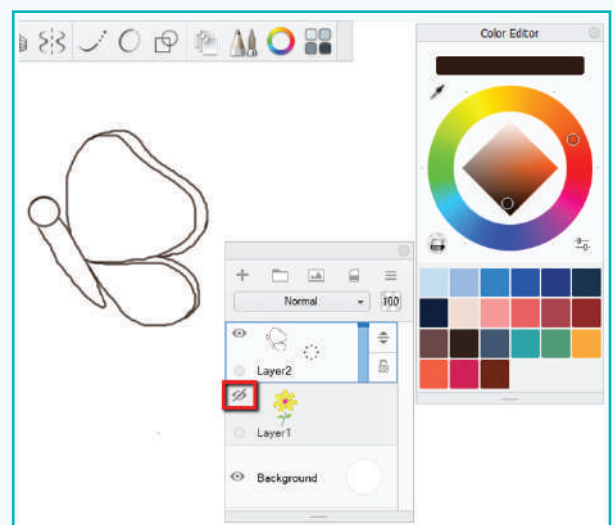

EXAMPLE: changes in Layer 1 will be visible only on Layer 1.

5 Draw the **butterfly** on **Layer 2**

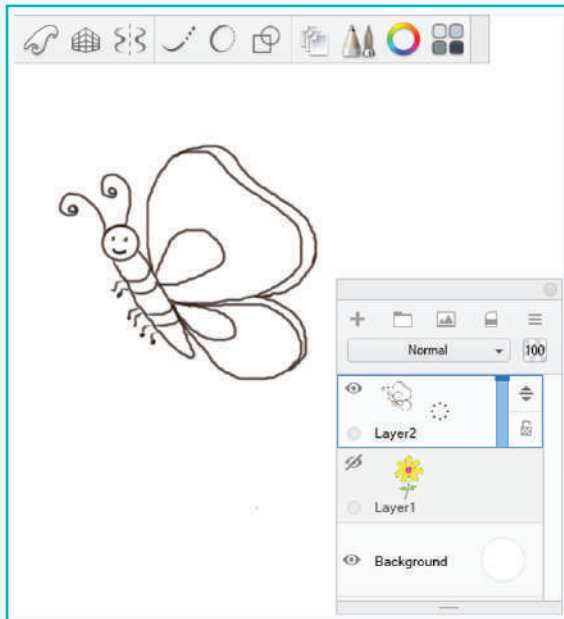

6 **Hide layer 1** to make changes in the butterfly.

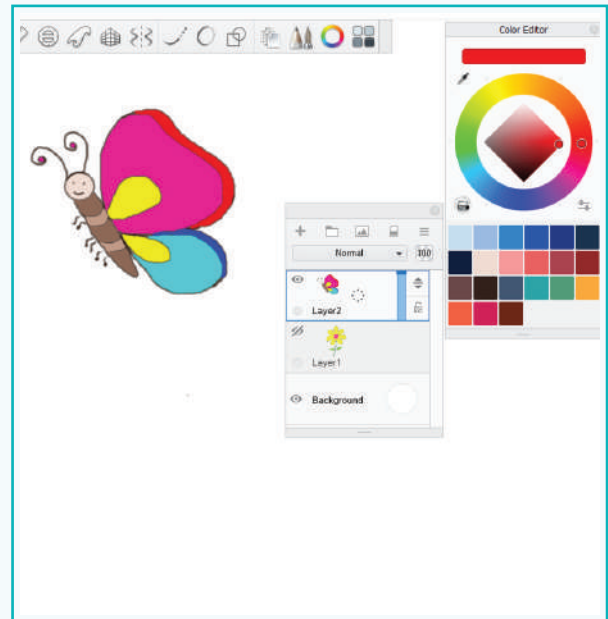

Activity

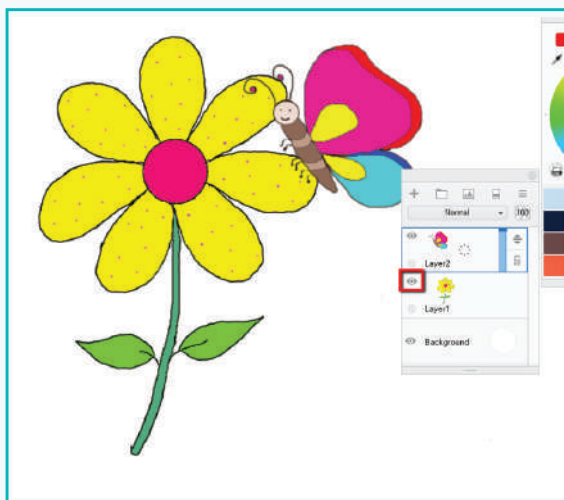

7 Complete the drawing of the butterfly.

8 Colour the butterfly.

9 Unhide Layer 1 to place the butterfly on top of the flower.

Hide and unhide options let us see the changes in the layers.

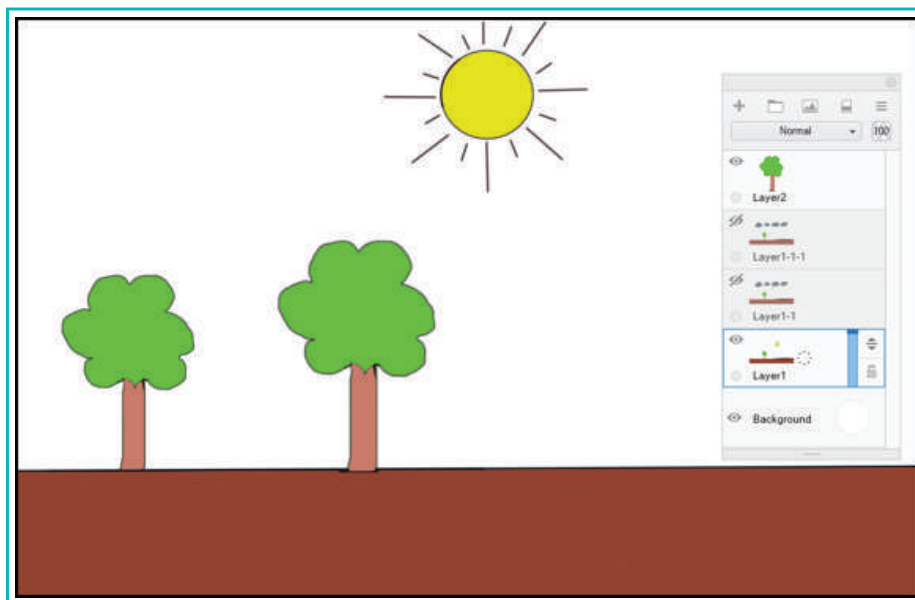

Butterfly on the flower

10 Save the drawing on the desktop. Name it **Butterfly on flower**.

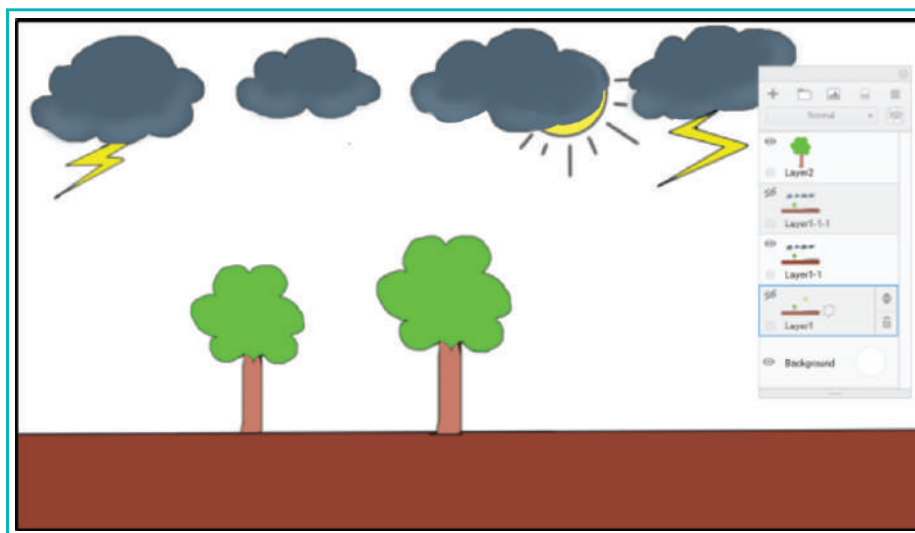

Advantages of layers:

- We don't need to draw the same thing again and again.
- We can add, view, hide and unhide different layers. We can work on them separately.
- We do not have to change anything on the previous layer. We can draw on the new layer separately.

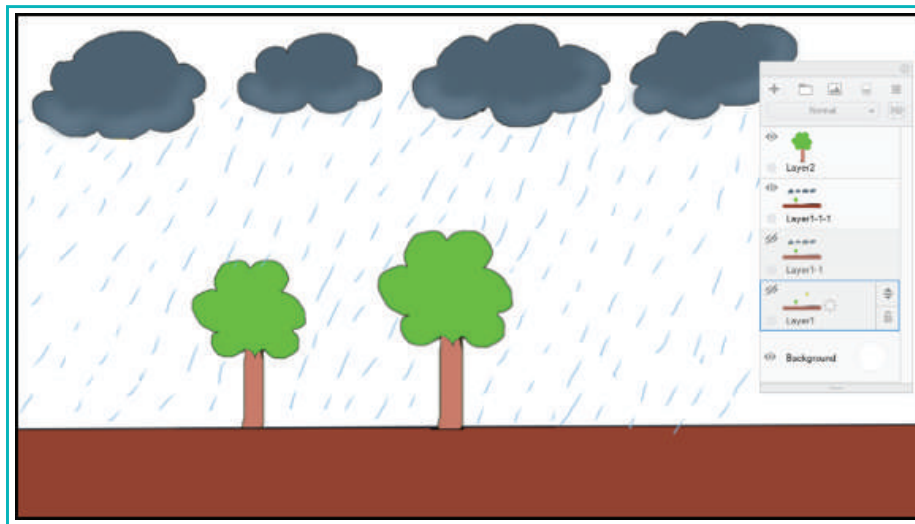

Example :

Sunny Sky (Layer 1)

Thunder in the sky (Layer 2)

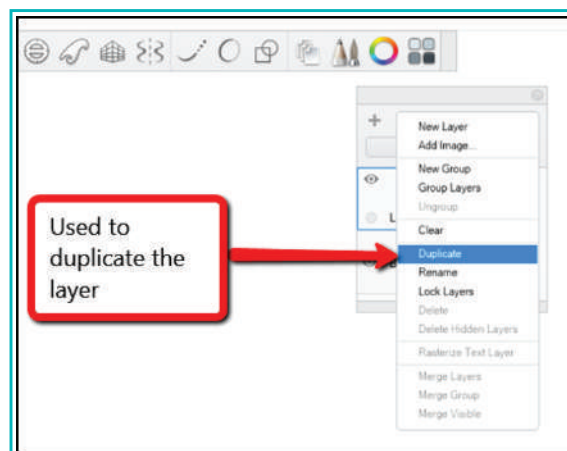

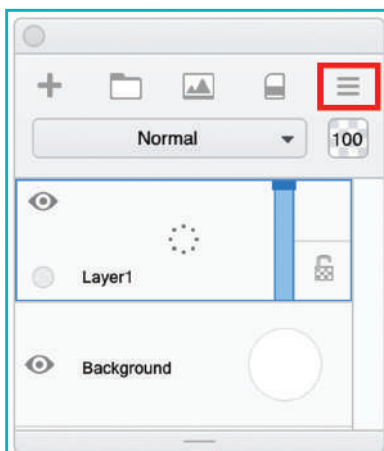

Rainy sky (Layer 3)

In the above example:

- First layer shows a sunny sky.
- Second layer shows clouds with lightning.
- Third layer shows a rainy sky. The sun from layer 1 is hidden. The lightning
- When we hide and unhide the layers, we see the weather change. By hiding and unhiding the layers we can see changes in the weather.

The trees are common in all weathers. Clouds are common in lightning and rainy weather. In sketchbook, we can duplicate a layer and use it again. This way we don't have to draw the same objects again.

- Duplicate is used to create an identical copy of something. In layers, it is used to create a copy of a layer.

Exercise

 Tick mark ☒ the correct answer

3 Changes can be seen when we _____ the layer.

-  a. Hide and Unhide ☐ b. Add ☐ c. Delete ☐

Tech Flash

1. **Window Menu** : It allows us to open and close different window options like color editor, toolbar, layer editor, etc.
2. **Layer Editor** : Layer in Sketchbook allow us to do changes in the same drawing without changing the previous one.
3. **New Layer** : It is used to add new layer; we can make any changes in new layer. Changes will be visible in that layer only.
4. **Hide and Unhide** : By hiding and unhiding the layer we can see the changes in drawing.
