

What are you doing Riya?

I am looking at photos from my first birthday. I was so small!

Haha, you were indeed. You have personal files on your laptop. You should add a password so that no one can view them without your permission.

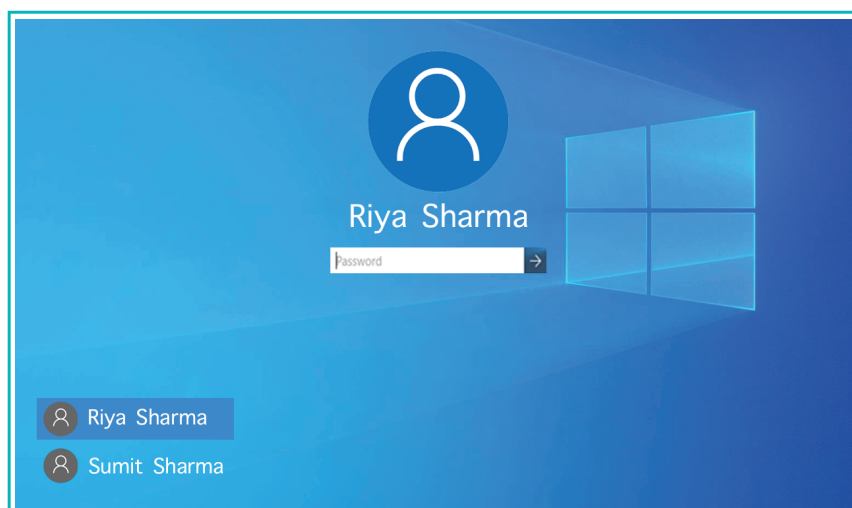

Personalise your PC:

- PC (Personal Computer) is where we store our personal information. This could be pictures, music, videos, and documents.
- When we share a computer with other people, we should create a user account. This helps to keep everyone's information separate.
- It does not allow others to make changes to our computer.
- We can protect our personal information by creating a user account.

User accounts

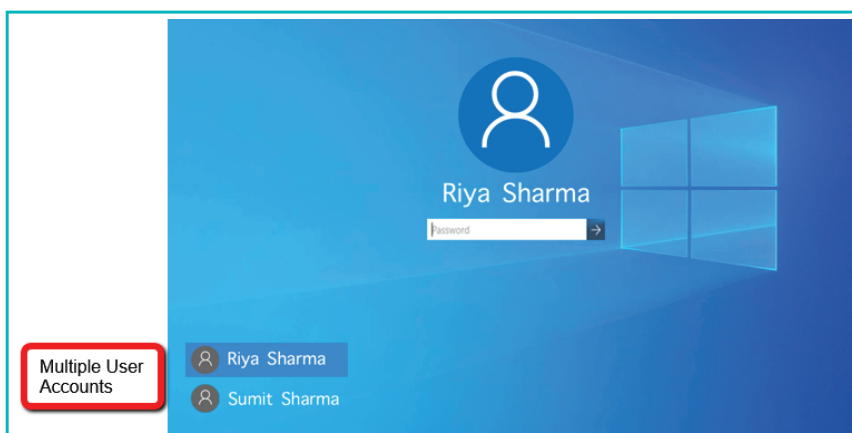

- This is a personal profile made for a person who uses a computer.
- A user account contains a **username** and a **password**. This is used to login onto the computer.

User accounts

User account

- In our user account, we can have our own desktop background. We can change settings and organise our folders as we like.
- We can create a separate user account for any other person to store their data.
- When the computer starts, we can select which user account we want to use. Here, we have to enter the password for that account.

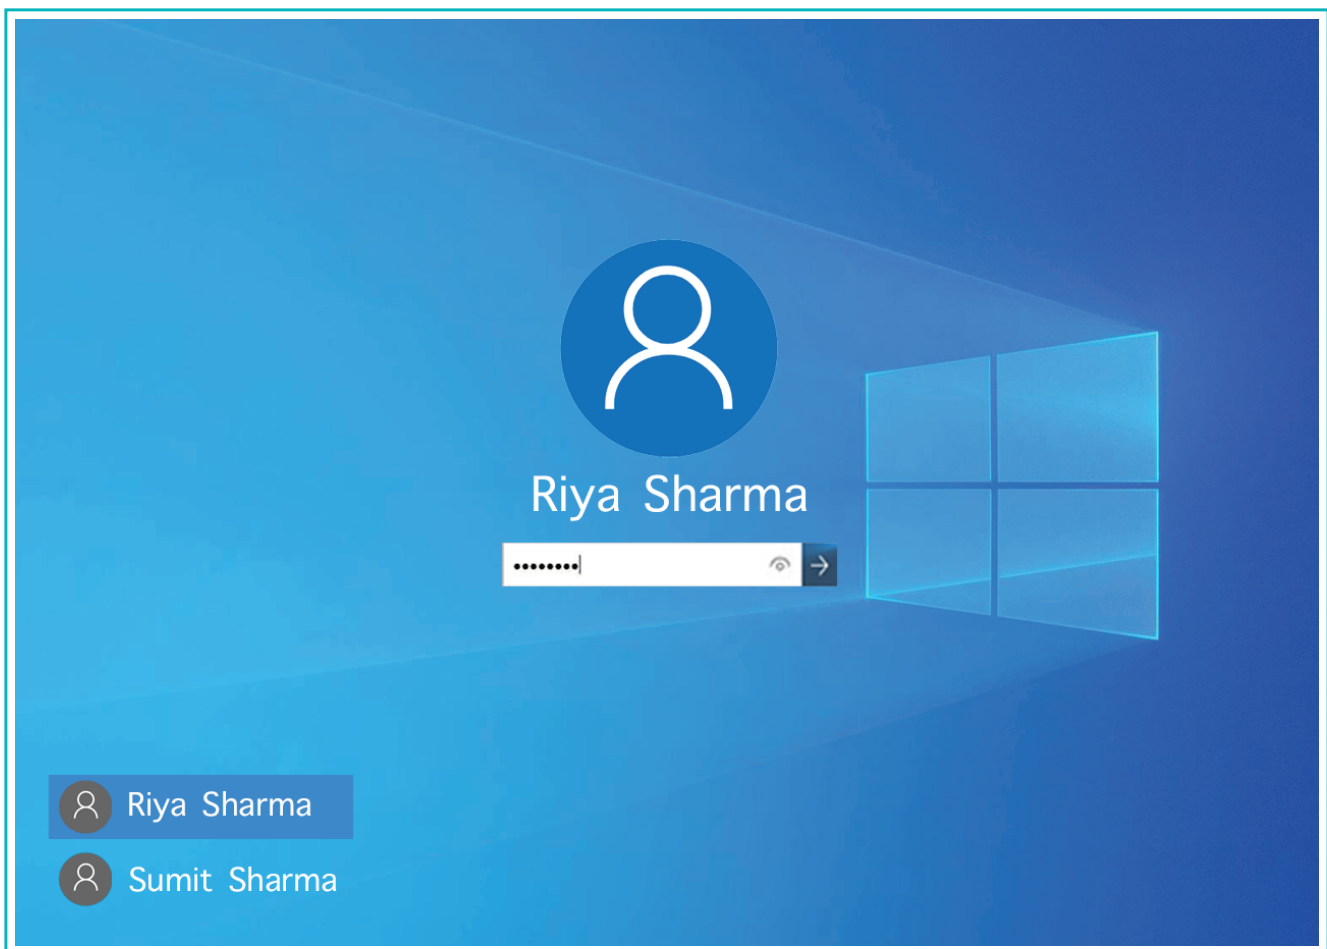

Multiple user account

Username

- A **username** is a unique name for each user. It is used to identify a user and allow access to the computer system.

Password

- A **password** is a series of secret characters. This allows us access to a computer.
- A password should be easy for us to remember but difficult to guess for other people.
- The password is always hidden and we cannot see what it says. Symbols appear instead of alphabets and numbers when we type

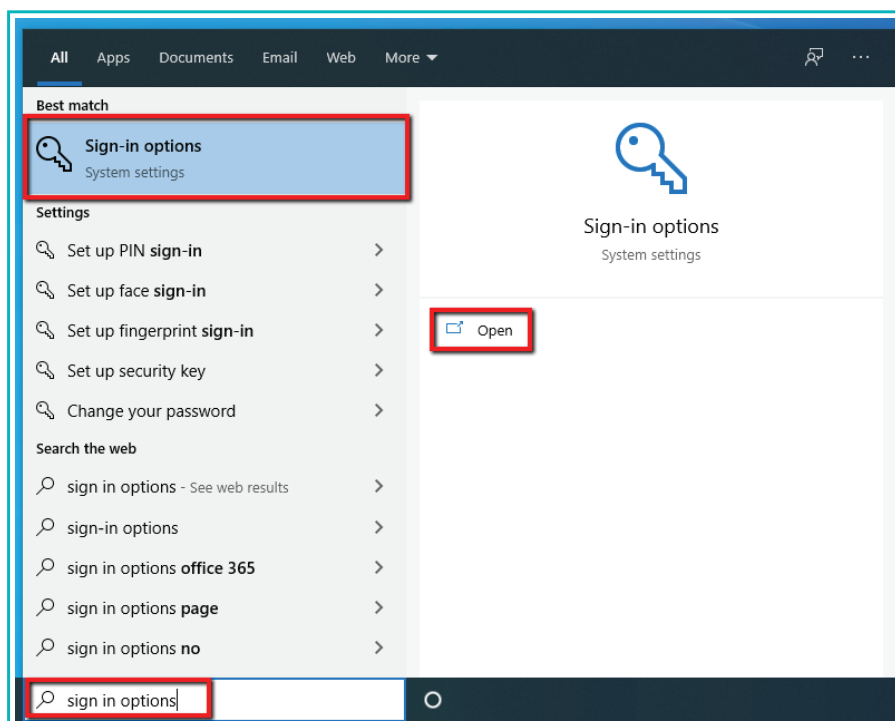

User account password

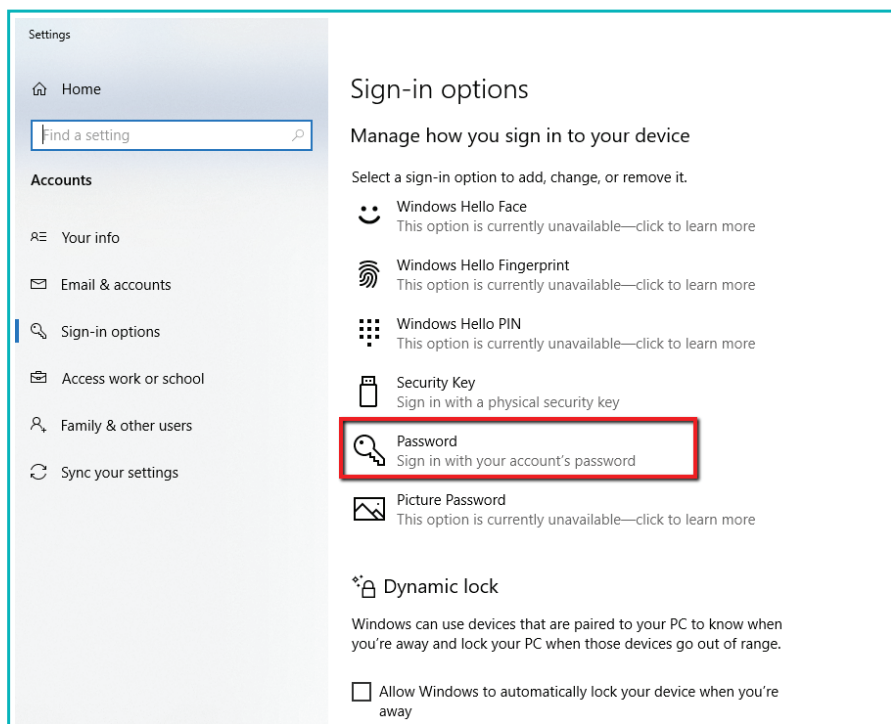

6. Passwords

If you do not have a password in your laptop then follow the below steps to add a password to a user login.

1. Type **Sign-in options** in the Search bar and open the **Sign-in options** setting as shown:

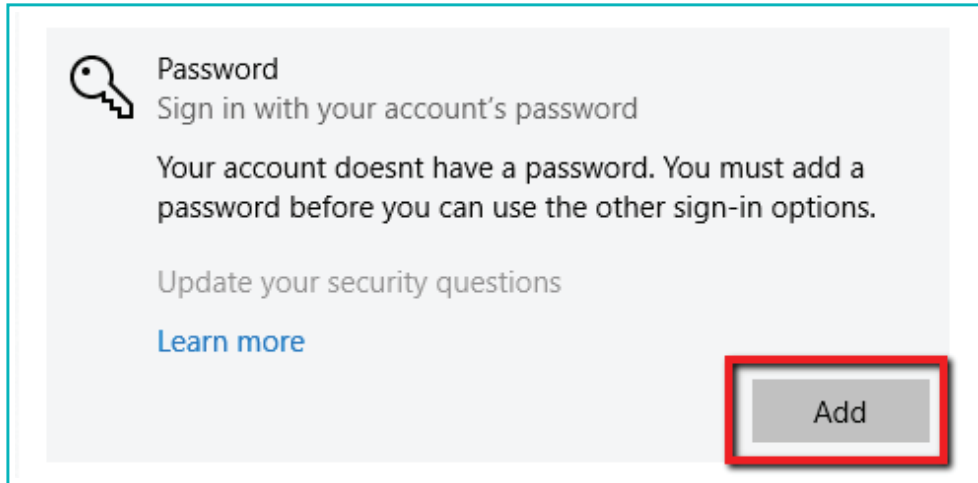

2. Click on the **Password** option as shown:

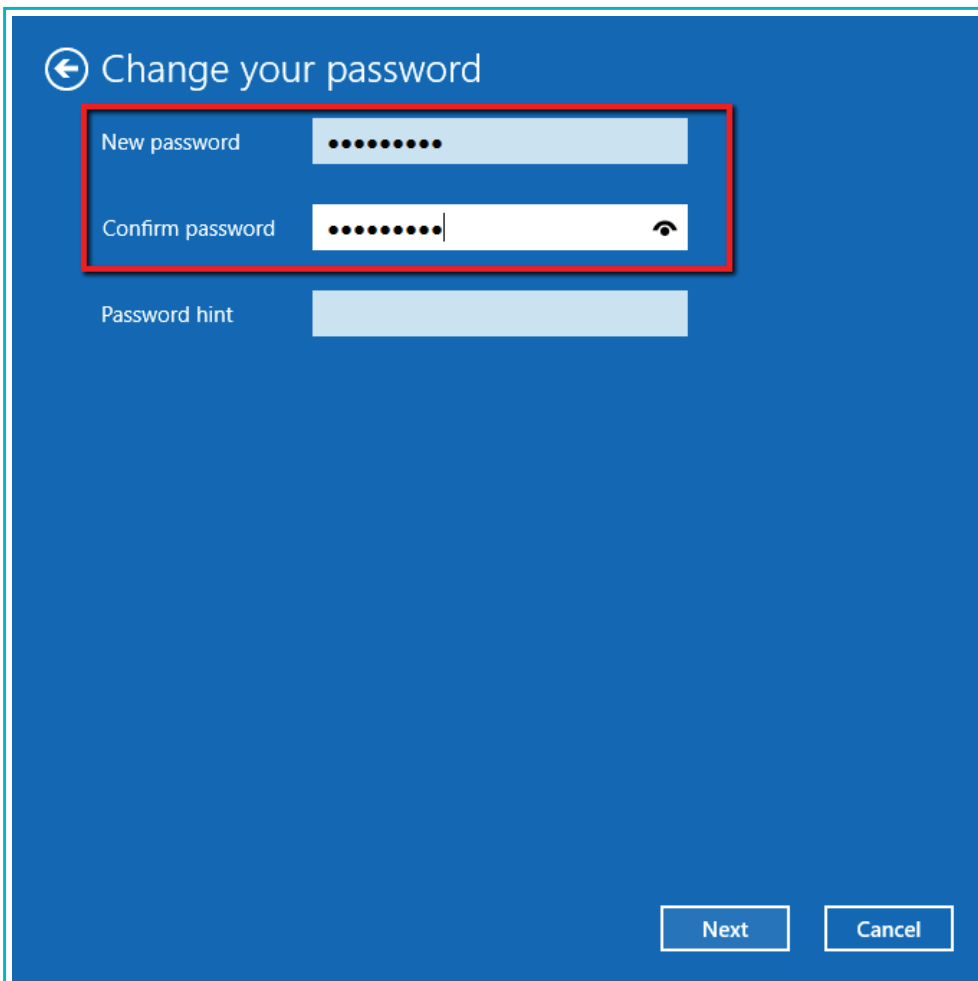

6. Passwords

3. Click on **Add** to set the password

A screenshot of a Windows login screen. At the top, there is a key icon and the text "Password Sign in with your account's password". Below this, a message states: "Your account doesnt have a password. You must add a password before you can use the other sign-in options." Underneath the message is a link that says "Update your security questions" and another link that says "Learn more". In the bottom right corner, there is a grey button labeled "Add", which is highlighted with a red rectangular box.

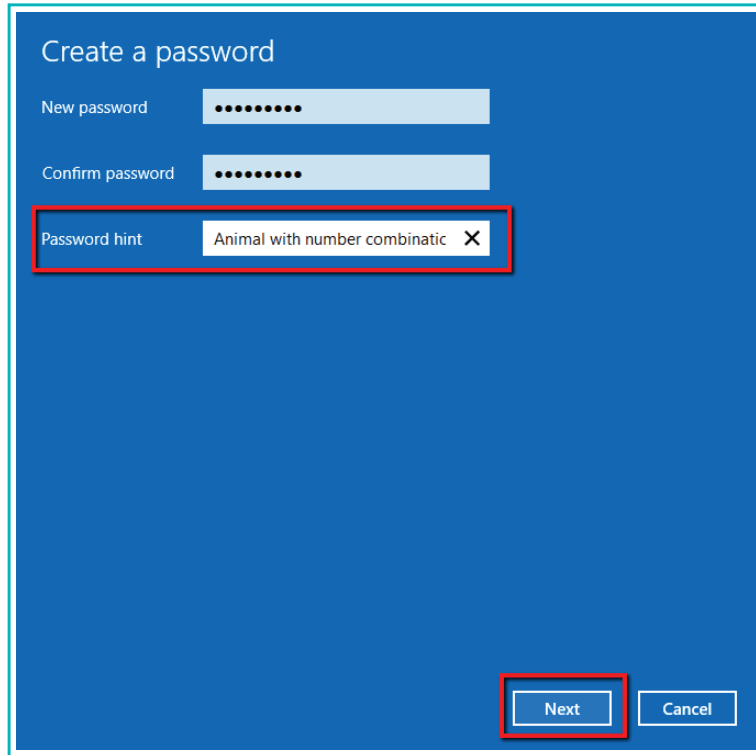

4. Enter the password you want to set in the **New password** box and reenter the same password in the **Confirm password** box

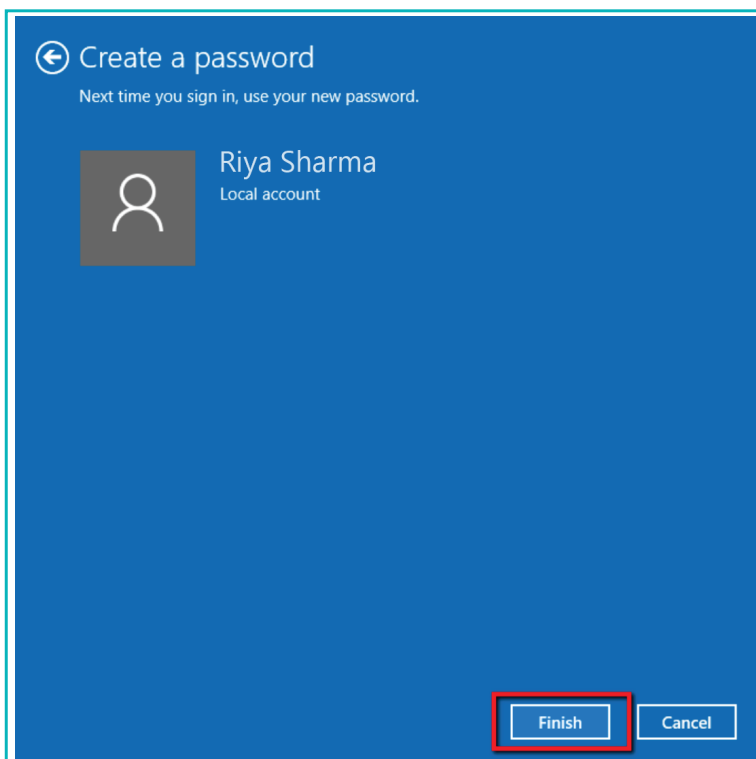

A screenshot of the "Change your password" window in Windows. The window has a blue background and a title bar with a back arrow and the text "Change your password". There are three input fields: "New password", "Confirm password", and "Password hint". The "New password" and "Confirm password" fields are highlighted with a red rectangular box. Both of these fields contain masked text (dots). The "Confirm password" field also has a small eye icon to its right. At the bottom right of the window, there are two buttons: "Next" and "Cancel".

6. Passwords

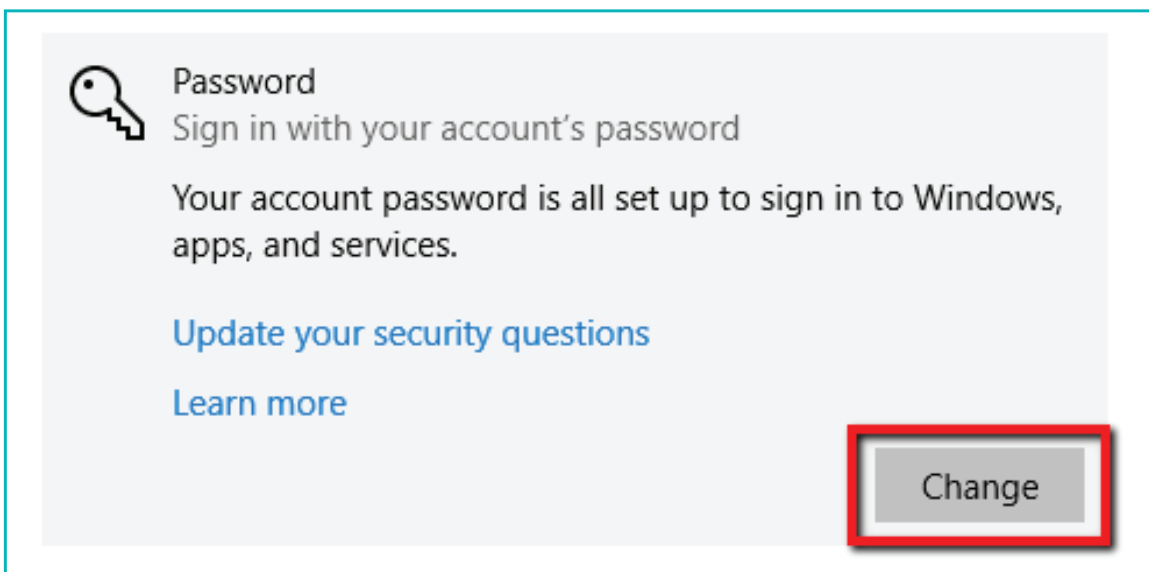

5. In case you forget the password, set a **Password hint** then click **Next**

6. Click on **Finish** button to set the password

7. If you want to change the password next time, you can click on **Change** button

Here are some tips to keep in mind to set a new password:

Points to be considered	Bad password	Good password
Passwords should be six to nine digits long. They should be easy to remember and difficult to guess.	1234	Dino_1231
Use a combination of characters. Use capital and small letters, numbers, and special characters.	apple	
Never use your name, date of birth, simple number series or any personal information for your password.	riya2010	

- Make a hint for the password in case you forget it.
- Carefully think about the password hint. Other users should not be able to figure it out.

Exercise

 **State whether True or False**

1 A password with 3–4 digits is considered a strong password.

 _____

2 When the computer starts, we will be able to select which user account we want to use.

 _____

Activity

 **Create and write down five passwords and their hints that you might use to protect your PC.**

For example: If your favourite animal is a Dinosaur, and your date of birth is 12th June 2013 then you can set a password as **‘Dino_1231’**.

In this we use half the word of your favourite animal, your birth date and reverse the number 13 to 31 of the birth year. Now, no one can guess this password easily.

Password hint: Animal with number combination.

Consider all the points we have discussed so far.

1. Password: _____

Password Hint: _____

2. Password: _____

Password Hint: _____

3. Password: _____

Password Hint: _____

4. Password: _____

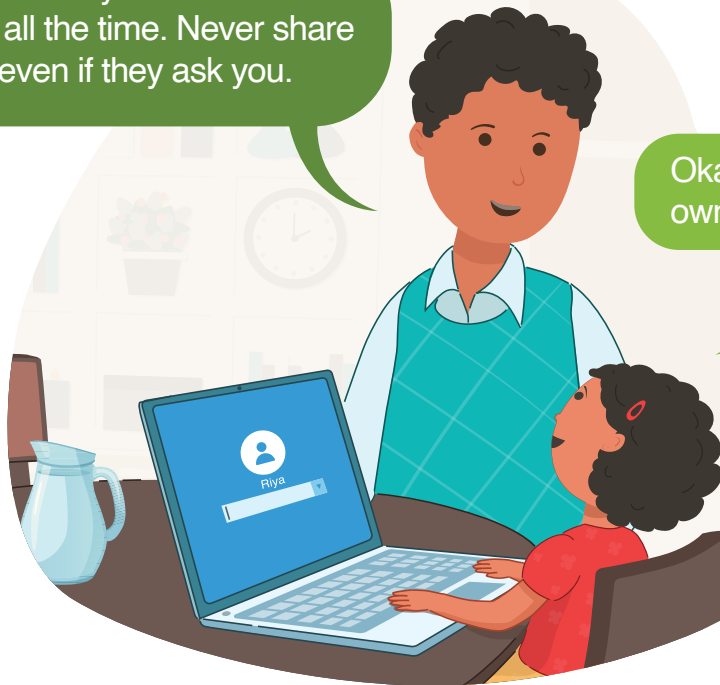

Password Hint: _____

5. Password: _____

Password Hint: _____

It is very important for you to remember your password all the time. Never share it with anyone, even if they ask you.

Okay Dad, I will make my own secret password now!

- 1. User account** : A personal profile made for a person who uses a computer. A user account contains a username and a password.
- 2. Username** : A unique name for each user. It is used to identify a user and allow access to the computer system.
- 3. Password** : A series of secret characters to allow access to a computer.
- 4. Password hint** : A reminder of how a password was set.

Future Tech

Biometric Passwords

Modern computers are replacing basic alphabet and numbers-based passwords with biometric passwords. It includes human features like voice recognition, face recognition, fingerprint and eye scan as added security.
